Simple Login and Logout System

System Requirements Specification

BACKEND-EXPRESS RESTFUL APPLICATION

1 PROJECT ABSTRACT

"**Login and Logout System**" is an express js application designed to to have a simple Login and Logout System using hotel management system. It leverages the ExpressJs with In-Memory as the database. This platform aims to provide APIs on the hotels, allowing users to browse, search for, have logging into and logging out features.

Following is the requirement specifications:

| | | |
|---------|--------------------------------|------------|
| | Simple Login and Logout System | |
| | | |
| Modules | | |
| | 1 | User |
| | 2 | Hotel |
| | 3 | Middleware |

| | | |
|-----------------------------|---|---------------------|
| User Module Functionalities | | |
| | | |
| | 1 | Register a new user |

| | | |
|------------------------------|---|--------------------------|
| Hotel Module Functionalities | | |
| | | |
| | 1 | Get all hotels |
| | 2 | Get hotel by ID |
| | 3 | Create a new hotel |
| | 4 | Update hotel information |

| | | |
|-----------------------------------|---|--|
| Middleware Module Functionalities | | |
| | | |
| | 1 | Implement logic to check and validate user credentials using Basic Authentication. |
| | 2 | Implement centralized error handling to return consistent error responses. (Already implemented) |

2 ASSUMPTIONS, DEPENDENCIES, RISKS / CONSTRAINTS

2.1 USER CONSTRAINTS

- When **registering a user**, if a user with the provided email already exists, the operation should throw a custom exception with the message: **"User already exists."**

2.2 HOTEL CONSTRAINTS

- When **creating a hotel**, the **name**, **location**, and **pricePerNight** fields should be mandatory. If any are missing, it should throw a custom exception with the message: **"Failed to create hotel."**
- When **fetching a hotel by ID**, if the hotel ID does not exist, the operation should throw a custom exception with the message: **"Hotel not found."**
- When **updating a hotel**, if the hotel ID does not exist, the operation should throw a custom exception with the message: **"Hotel not found."**

Common Constraints

- All RestEndpoint methods and Exception Handlers must return data in json format.
- Any type of authentication and authorisation must be added in routes file only.

3 REST ENDPOINTS

Rest End-points to be exposed in the routes file and attached with controller method along with method details for the same to be created. Please note, that these all are required to be implemented.

3.1 USER RESTPOINTS

| URL Exposed | | Purpose |
|------------------------|--|----------------------|
| 1. /api/users/register | | Registers a new user |
| Http Method | POST | |
| Body | name (string) email (string) password (string) age (number) | |
| Return | Created user along with message: "User | |

| | | |
|--|--------------------------|--|
| | registered successfully" | |
|--|--------------------------|--|

3.2 HOTEL RESTPOINTS

Note:

Any route which must be authenticated (there must be valid token) are marked with `authMiddleware`

| URL Exposed | | Purpose |
|--------------------|---|--|
| 1. /api/hotels | | Fetches all the hotels |
| Http Method | GET | |
| Parameter | - | |
| Return | list of hotels | |
| 2. /api/hotels/:id | | Fetches a hotel by its ID |
| Http Method | GET | |
| Parameter | id | |
| Return | fetches hotel | |
| 3. /api/hotels | | Creates a new hotel (protected) [authMiddleware] |
| Http Method | POST | |
| Body | name (string) location (string) pricePerNight (number) | |
| Return | Newly created hotel along with message as "Hotel created successfully" | |
| 4. /api/hotels/:id | | Updates an existing hotel (protected) [authMiddleware] |
| Http Method | PUT | |
| Parameter | id | |
| Body | name (string) location (string) pricePerNight (number) | |
| Return | Updated hotel along | |

| | | |
|--|--|--|
| | with message as "Hotel updated successfully" | |
|--|--|--|

4 TEMPLATE CODE STRUCTURE

4.1 User code structure

1. User: controller

Resources

| File | Description | Status |
|----------------------------------|---|-------------------|
| UserController (Class) | This is the controller class for the user module. | To be implemented |

2. User: models

Resources

| File | Description | Status |
|-------------|-----------------|---------------------|
| user | Models for user | Already implemented |

3. User: routes

Resources

| File | Description | Status |
|-------------------|-----------------|-------------------|
| userRoutes | Routes for user | To Be implemented |

4.2 Hotel code structure

1. Hotel: controller

Resources

| File | Description | Status |
|-----------------------------------|--|-------------------|
| hotelController (Class) | This is the controller class for the hotel module. | To be implemented |

2. Hotel: models

Resources

| File | Description | Status |
|-------|------------------|---------------------|
| hotel | Models for hotel | Already implemented |

3. Hotel: routes

Resources

| File | Description | Status |
|------------|------------------|-------------------|
| userRoutes | Routes for hotel | To be implemented |

4.3 MiddleWare

Resources

| File | Description | Status |
|----------------|---|---------------------|
| authMiddleware | Middleware that performs Basic Authentication using username and password validation.. | To be implemented |
| errorHandler | Centralized error-handling middleware that returns consistent error responses across the application. | Already implemented |

5 METHOD DESCRIPTIONS

5.1 Controller - Method Descriptions:

1. UserController Class - Method Descriptions:

| Method | Task | Implementation Details |
|--------------|------------------------|---|
| registerUser | To register a new user | <ul style="list-style-type: none">- The request type should be POST with URL /api/users/register.- Accepts name, email, password, and age from the request body.- Checks if a user with the given email already exists in the in-memory users array (read from user model).- If a user exists, return 400 status with message: 'User already exists'.- If not, hashes the password using bcrypt with a salt round of 10.- Creates a new user object with a hashed password and pushes it into the users array.- Return 201 status with message: 'User registered successfully' and the user data (excluding plain password).- On error during hashing, throws the error. |

2. HotelController Class - Method Descriptions:

Note:- Data must be read from the hotel model as this is an in-memory project.

| Method | Task | Implementation Details |
|--------------|---------------------------------------|---|
| getAllHotels | To retrieve all hotels (public route) | <ul style="list-style-type: none">- The request type should be GET with URL /api/hotels.- Responds with status 200 and the list of all hotels.- This is a public route with no authentication required. |

| | | |
|--------------|---|--|
| getHotelById | To retrieve a hotel by its ID (public route) | <ul style="list-style-type: none"> - The request type should be GET with URL parameter /api/hotels/:id. - Searches the hotel list using the provided ID. - If found, respond with status 200 and the hotel object. - If not found, respond with status 404 and message: 'Hotel not found'. |
| createHotel | To create a new hotel (protected route) | <ul style="list-style-type: none"> - The request type should be POST with URL /api/hotels. - Accepts name, location, and pricePerNight from request body. - Creates a new hotel with a unique ID and adds it to the array. - Responds with status 201 and message: 'Hotel created successfully' along with the created hotel. |
| updateHotel | To update an existing hotel by ID (protected route) | <ul style="list-style-type: none"> - The request type should be PUT with URL parameter /api/hotels/:id. - Finds the hotel by ID (param) and updates provided fields: name, location, pricePerNight (from body). - If not found, respond with 404 and message: 'Hotel not found'. - Otherwise, respond with 200 and message: 'Hotel updated successfully' along with the updated hotel. |

5.2 Routes - Descriptions:

1. User Routes:

| Method | Task | Implementation Details |
|--------------|------------------------|---|
| registerUser | To register a new user | <ul style="list-style-type: none"> - Create a POST route at /register. - Call userController.registerUser inside the route. - Use express.Router() to define and export the route. |

2. Hotel Routes:

| Method | Task | Implementation Details |
|--------------|---------------------------------------|---|
| getAllHotels | To fetch all hotels | <ul style="list-style-type: none">- Define a GET route at <code>/hotels</code>.- Call <code>hotelController.getAllHotels</code>. |
| getHotelById | To fetch a hotel by its ID | <ul style="list-style-type: none">- Define a GET route at <code>/hotels/:id</code>.- Call <code>hotelController.getHotelById</code>. |
| createHotel | To create a new hotel | <ul style="list-style-type: none">- Define a POST route at <code>/hotels</code>.- Use <code>authMiddleware</code> for Basic Auth.- Call <code>hotelController.createHotel</code>. |
| updateHotel | To update an existing hotel by its ID | <ul style="list-style-type: none">- Define a PUT route at <code>/hotels/:id</code>.- Use <code>authMiddleware</code> for Basic Auth.- Call <code>hotelController.updateHotel</code>. |

5.3 MiddleWare - Method Descriptions:

| Middleware | Purpose | Implementation Details |
|----------------|--|---|
| authMiddleware | To authenticate users using Basic Authentication | <ul style="list-style-type: none">- Checks for the 'Authorization' header and validates its format.- If missing or malformed, returns 401 with message: 'Authorization header is missing or malformed'.- Decodes the base64-encoded credentials to retrieve username and password.- If username or password is missing, responds with 400 and message: 'Username and password are required'.- Looks up the user from an in-memory user list by email. |

| | | |
|--|--|--|
| | | <ul style="list-style-type: none"> - If user not found, responds with 400 and message: 'Invalid username or password'. - Compares the provided password with the stored password hash using bcrypt.compare. - Logs whether the password is correct or not as "Password is correct!" or "Password is incorrect!" respectively. - If match is found, continues to the next middleware using next(). - On bcrypt error, logs the error and does not proceed. |
|--|--|--|

EXECUTION STEPS TO FOLLOW FOR BACKEND

1. All actions like build, compile, running application, running test cases will be through Command Terminal.
2. To open the command terminal the test takers, need to go to Application menu (Three horizontal lines at left top) -> Terminal ->New Terminal.
3. This editor Auto Saves the code.
4. These are time bound assessments the timer would stop if you logout and while logging in back using the same credentials the timer would resume from the same time it was stopped from the previous logout.
5. To test any Restful application, the last option on the left panel of IDE, you can find ThunderClient, which is the lightweight equivalent of POSTMAN.
6. You can follow series of command to setup express environment once you are in your project-name folder:
 - a. npm install -> Will install all dependencies -> takes 10 to 15 min
 - b. npm run start -> To compile and run the project.
 - c. npm run jest -> to run all test cases and see the summary of all passed and failed test cases.
 - d. npm run test -> to run all test cases and register the result of all test cases. **It is**

mandatory to run this command before submission of workspace -> takes 5 to 6 min
